

**TECHNICAL DATA SHEET**  
**April 1, 2011**

---

**DSC DEFOAMER**

---

***Description:***

**DSC DEFOAMER** is a blended alcohol-based compound used to reduce and prevent entrained air in fresh water and brine fluids.

---

***Application:***

**DSC DEFOAMER** may be slowly added directly to the fluid in the mixing tank. In cases of severe foam, immediate reduction can be attained by spraying or broadcasting directly to the foam surface. Normal recommended treatment is 5 gallons of Defoamer per 250 barrels of fluid. In high-density brines the loading level of DSC Defoamer should not exceed more than 0.05% by volume otherwise excess active material of the Defoamer will be clumped.

---

***Handling and Storage:***

**DSC DEFOAMER** is a flammable industrial chemical and should be treated with the same precaution as used with distillates, solvents, weak acids and alkalis. Avoid open flame. Do not take internally. Avoid contact with the skin and eyes. In the event of eye contact, immediately flush with large quantities of water and immediately seek medical attention. For skin contact, remove with soap and water. Openings on containers should always be kept closed when not in use.

---

***Packaging:***

**DSC DEFOAMER** is packaged in 5-gallon pails.
